Book: **Parallel Weapons, or What and How to Kill in the XXI Century**

PART III

PSYCHOTRONIC WEAPONS

Parallel Weapons, or What and How to Kill in the XXI Century

PSYCHOTRONIC WEAPONS

PSYCHOTRONIC WEAPONS

...And let free the souls that you catch,

to come to you.

Ezekiel 13:20

Hypnosis and zombification

The story of psychotronic weapons we will begin from afar, from those times when there was no science "psychiatry", but there was the use by man of the possibilities inherent in him by nature, in therapeutic (conspiracy, suggestion), political (influence on subjects) and, this is eternal, fraudulent purposes. The history of hypnosis - the invasion of the human psyche from the outside - can be traced back to the time when the written history of mankind is calculated, although apparently hypnosis was also used in prehistoric times. This can be judged from the hypnotic abilities of the sorcerers of savage tribes who did not know writing. Cuneiform tablets found between the Tigris and Euphrates rivers indicate that the oldest known cultural people in the world, the Sumerians, knew about hypnosis as early as the 4th millennium BC.

The priestly school of Erech has kept a handwritten document since ancient times, which was constantly being rewritten. Fragments of this document have survived and contain incontrovertible evidence that in those days the most educated doctors among the priests treated patients by suggestion in a hypnotic state, that is, they used hypnosis just as they do nowadays. The Sumerian priests also knew three degrees of hypnosis: mild, moderate and deep. Today, [experts](#) distinguish these three degrees of hypnosis in exactly the same way.

The Sanskrit code of Manu's laws also mentions the above classification of hypnotic states. Here they are called "waking sleep," "dreaming sleep," and "blissful sleep. The yogis of the higher stages still use in their practice self-hypnosis, which is an integral part of their teachings.

Even in ancient Egypt, hypnosis was used as a therapeutic tool. For example, the Ebers papyrus, which is three thousand years old, describes the methods of using hypnosis by the healers of that time. These methods have much in common with those used today. The Egyptian priests were also folk doctors. At the beginning of a hypnotic session, they held a shiny metal disk in front of the patient's eyes, in order to make his eyes tired and the patient fall into a hypnotic sleep. This technique is still used today. The ancient Egyptians were also aware of the imposition of hands accompanied by an appropriate suggestion. One ancient Egyptian document says, "...Put your hands on him to soothe the pain in his hands, and tell him that the pain will go away." At that time there were temples in which the sick were allowed to sleep who sought healing from the gods. The most famous of these were the temple of Serapis at Canopus and the temple of Isis. Hypnosis and temple sleep

were known to the ancient Greeks. The patients who came to the temple were initially kept on a certain diet for a period of time. The next stage of preparation for the treatment itself was the incense baths and ritual ablutions. Then the priest told the sick about cases of successful healing, in order to set them in the mood for the coming event and increase the tension of expectation. Only after that were the patients allowed to go to a therapeutic sleep. During sleep the priests whispered certain words of suggestion to the sick, so that the atmosphere in the temple would awaken the powers of self-healing. After awakening, the priests interpreted the dreams of the patients and strictly enjoined them to follow the advice of the gods. At that time, as now, there were patients who could not fall asleep and, therefore, were not amenable to hypnosis. For such cases there were priests in the temples who had the gift of mediumship. Falling into a trance, they made contact with the gods. In the famous temple of Apollo at Delphi, at the edge of a crevice in the rocks, from which the vapors rose, a priestess sat on a golden tripod. Inhaling these vapors, the priestess fell into a trance and, answering questions, conveyed advice to the gods. In other temples the priests put themselves into a trance by ritually burning various plants.

The Romans also had mediums who made contact with the gods for those who were sick or seeking counsel. Even philosophers used hypnosis and suggestion. The Roman poet Porphyry, who lived in the third century A.D., tells of a scientific dispute between the philosophers Plotinus and Olympius. Their disciples argued among themselves about which of the teachers had more knowledge. Finally, Plotinus challenged Olympius to a competition in the "magical arts". This contest was to take place in the presence of their students. Plotinus walked up close to Olympius and stared intently into his eyes for several minutes, then he exclaimed: "Look, now I am going to tighten Olympius' body like a purse of money!" And Olympius instantly felt intense pain and had to admit that his opponent had great fortitude.

Hypnosis in the form of temple sleep persisted until the middle of the sixth century. Then the legacy of the priests was gradually taken over by Christian monks, who practiced miraculous healings with prayers, holy water, relics of holy martyrs, and the laying on of hands. The latter was the prerogative of popes and kings. The New Testament says: "They shall put their hands upon those who are sick, and they shall become better...". Self-hypnosis was first mentioned in the 11th century by the monks of the Geschichast Order on Mount Athos. They put themselves in a state of self-hypnosis, fixing their eyes on their own navel. For this they were called omphalopsychians, or contemplators of the navel.

Theophrastus von Hohenheim (1493-1541), better known as Paracelsus, taught that the decisive driving force behind any healing was the "inner physician. Paracelsus wrote that monks in Carinthia healed the sick by making them look into a brilliant crystal ball. The sick usually fell into a deep sleep. During this sleep, the monks would compel the sick to recover, which in most cases occurred.

The Inquisition forced this therapy into oblivion, for anyone who was capable of practicing it could be declared an accomplice of the devil. But hypnosis and suggestion are used even nowadays, not only for therapeutic purposes, but also for criminal and investigative purposes.

A person who has been "programmed by hypnosis" outwardly behaves like an ordinary person and does not suspect that he has been "programmed. He reacts only to a key command given to him at the right time. After completing the task he does not even realize what he did at this command - the program told him to forget this fact. Several special programs can also be placed in such a person's subconsciousness.

An illustration of such programming is the famous case of the arrest of CIA agent Luis Castillo, accused of assassinating Philippine President Marcos. Before the interrogation, the agent was injected with a "truth serum" - a psychotropic drug - and underwent a series

of hypnotic sessions. It turned out that this man in different situations felt like four different agents with different "legends", and each of his personalities knew nothing about the others. Apparently, having subjected Castillo's brain to a complex psychophysical processing, several programs were put into him at once, each representing some task. The new personality was probably "turned on" with the help of a certain code.

The hypnotist who worked with him during the interrogations discovered that the arrestee could be at four different levels. At the first level, Castillo referred to himself as Antonio Reyes Yeloriaga; at the second level, he presented himself as a CIA agent; at the third level, he was an agent who had failed and was about to commit suicide; at the fourth level, the agent admitted that his name was Manuel Angelo Raires from New York, who had been trained in a CIA special camp, where he trained in subversive activities. And at each stage his physiological state also changed: his pulse, breathing rate, perspiration, his behavior was that of a somnambulist. He constantly looked around, could stand up, move, and pull the trigger of his gun, but did all this unconsciously, like a robot, devoid of human consciousness, he did not even feel pain.

...But let us continue. Obviously, at some period the tribal sorcerer, who possessed hypnosis, passed away. There was a need to find other possibilities, ways to influence the human psyche, which would not depend on natural abilities, but could be transmitted from witch to witch. And such means were found by African voodoo sorcerers.

Zombies are people in Africa who are deprived of their alter ego (self) by means of special drugs and special psychic influences. Zombies have no fear and are ready to fulfill any order of their adept: to kill their mother, their child and even themselves. How do zombies become? It is said that a voodoo sorcerer sucks the soul of a sleeping person and puts it into a special bottle. The soulless person soon dies, is buried, and at midnight after the burial, the sorcerer and his assistants dig up the grave. The name of the victim is pronounced, after which the dead man allegedly tries to raise his head because the sorcerer holds a vessel with his soul in his hand. As soon as he did it, the vessel is brought to the nose of the deceased and opens for a split second as if releasing a part of the captive soul. It is believed that by doing this, life returns to the body. Completing the ritual, the sorcerer walks the reanimated zombie past his house and reads spells to deprive the victim of the memory of his past life forever.

Another way to steal a soul is for a sorcerer to put a vessel with magical objects under a pillow, which will attract the soul. Finally, a sorcerer may prepare a special potion that paralyzes a person and thereby deprives him of his ability to resist. This potion not only creates the appearance of death, but also permanently incapacitates the most important brain centers, depriving the person of memory and the ability to think. Upon awakening, the creature can no longer be called human, but an obedient, emotionless zombie.

Zombification is used by sorcerers for a variety of reasons. Usually it is done out of a sense of revenge against the person, or when they want to get a work force - zombies devoid of feelings and thoughts are ideal performers of hard physical work.

The American Wade Davis was able to determine that the main ingredient was a powder prepared from dried puffer fish (puffer fish, death fish). Chemists have determined that this fish kills its victims with tetrodotoxin, one of the most dangerous nerve poisons. Suffice it to say that a dose of one ten-thousandth of a gram is fatal for humans, which exceeds the potassium cyanide effect by a factor of 500.

The second ingredient is sea toad poison. At night the sorcerer keeps the toad in a jar together with a sea worm, which bites it and forces it to produce the poison. It contains the active chemicals bufotein, bufogenin and bufotoxin. Dried and grinded human or large animal gallbladder, some herbs, crushed human remains, etc. were added to the resulting

mixture of poisons. Then various ritual acts followed, after which the powder was ready for consumption.

By zombifying the living mind, destroying holistic thinking, the destroyer achieves the effect described by E. V. Lutsenko in his book "Experience in Researching Higher Forms of Consciousness". The author writes that positive hallucinations are those in which a person sees something that does not exist in reality. In negative hallucinations, on the contrary, a person does not see what is actually there. It is also possible to indoctrinate a person with a "substitution" hallucination, in which one sees other, predetermined objects instead of certain objects, and a "correction" hallucination, in which the given adequate images of real objects are corrected according to predetermined rules before they enter the consciousness.

Hypnotic and voodoo methods of influence are used by intelligence agencies of all countries to recruit so-called agents of influence, although money, women, alcohol, and simply hypertrophied client ego bordering on stupidity play no small role here, as was the case with our unforgettable first presidents. These are the same methods used by various totalitarian sects to process their flock. At the end of 1991, despite Japanese warnings, Seko Asahara, a teacher from the Aum Sanriku sect, received active support in Russia from Chairman of the Supreme Soviet of the Russian Federation Ruslan Khasbulatov and Security Council Secretary Oleg Lobov. He was even given the opportunity to preach his teachings on 2 x 2 TV channel and Radio Mayak. Asahara taught deep zombie techniques at the Olympic Sports Complex. Politicians seemed unaware that Asahara preached the denial of children from their parents. Mothers and fathers abandoned their children and gave the sect all their possessions and savings. The sect was legal in Russia until it became known that its members were involved in kidnappings and the mass poisoning of Tokyo subway passengers with sarin gas on March 20, 1995.

Asahara told the sectarians that zombification was useful, because if you needed something from a particular person, you had to zombify him, and he would fulfill your every wish. The teacher did not explain to the sectarians all the subtleties of zombification, in particular, that the person zombified by the sect is programmed for self-destruction, and after a while, if he does not commit suicide, he will die of illness. Perhaps it is appropriate to remember that many of those "coded" from alcoholism in a crisis situation (return to alcohol use) commit suicide or try to do so.

Of course, Asahara and others like him, the gurus of various totalitarian sects, seem to be artisans when it comes to the state machine. It would be strange if not only scammers and crooks, but also military and intelligence officers did not come up with the idea of using the experience of hypnotists and voodoo sorcerers combined with modern technology. And so the end of the XX - beginning of the XXI century was marked by the creation and use in practice of weapons of mass destruction, called psychotronic, or psychophysical. The science that deals with the development of psychotronic weapons is called psychotronics, by analogy with electronics. The idea belongs to Ferdinand Clark, who back in 1952 said: "We may suggest the name 'psychotronics' for phenomena in which the energy produced by the process of thinking and the energy reproduced by an impulse of the human will and a simple concentration thereof can make a drop of water in a vacuum deflect to the left or to the right."

Circulation of this so-called non-lethal weapon and its components is prohibited on the territory of Russia in accordance with Supplement No. 103-FZ of July 26, 2001, to Article 6 of the Federal Law "On Weapons".

But, as we can assume from practice, if there is a demand, there is a supply.

Psychotronic Poison

...Our ordinary waking consciousness...is but one particular kind of consciousness, whereas all around us, behind the thinnest veil, are the potentialities of an entirely different consciousness...just make the effort, and we'll feel them close by.

William James

Reserve Major General Boris Ratnikov, former first deputy head of the Main Security Directorate of the Russian Federation: "I saw the antenna installed in Yeltsin's office behind the book wall. It was a tarpaulin-covered metal frame measuring 1 m 20 cm by 1 m 20 cm, in the middle of which was attached a radio transmitter. Who turned it on or off, I have no information... As material evidence, the antenna, which was in Yeltsin's possession, was stolen in 1991.

The antenna was installed in order to protect Yeltsin from external influences. The more so because at the same time - in the beginning of the 1990s - all sorts of "psychic *tricks*" began to be used in election campaigns (and not only).

There was a document: "Price list of services to ensure the election campaign" (program of work with candidates) of December 16, 1995. The psychic "security of candidates" cost \$3,000 per month with travel and stay in the region. To zombify the entire population of the city to go and vote for the right candidate, for 2-5 working days, the magicians were asking for \$2000. The psychics were paid several thousand dollars to install protective psychotronic devices and to neutralize the external influence "upon additional agreement". The cheapest service of the "magicians" - accompaniment during the performance to maintain the image - cost \$150 per hour.

But in order...

...The history of development of psychotronic weapons in Russia can begin with the electro-induction hypothesis of "mesmeric interaction of organisms", which was stated in 1875 by the famous Russian chemist Alexander Mikhailovich Butlerov. He suggested that the "nervous currents of organisms" could interact, just as electric currents in conductors do. In 1887, Julian Ochorovich, professor of philosophy, psychology, and physiology at the Lvov University, gave a detailed substantiation of the electroinduction hypothesis of mental suggestion.

The electroinduction hypothesis explained the interaction of organisms only at close distances. This problem was successfully overcome by the electromagnetic hypothesis of telepathy.

The coming to power of the Bolsheviks did not stop research in this direction. On the contrary, Lenin's government, obsessed with the idea of "world revolution," was interested in obtaining a fundamentally new kind of weapon with which to fundamentally change the situation in Russia. In the years when the whole country was starving, the Brain Institute had no shortage of funds or specialists.

In the mid-1920s, Aleksandr Leonidovich Chizhevsky was also involved in the development of psychotronic weapons, which, however, did not have this terrible name at the time.

At the end of 1923, Chizhevsky became a member of the Laboratory of Zoopsychology.

He defended the idea of the presence in cells and organs of "formations identical to the elements of a radio circuit. Most of all he was interested in questions of individual and mass suggestion. In this connection he wrote the book "Physical Factors of the Historical

Process", which was published in Kaluga in 1924. In this book Alexander Chizhevsky is inclined to the idea that "the phenomena of suggestion - individual and mass - can be explained by electromagnetic excitation of centers of one person by corresponding centers of another".

History abounds with eloquent facts of mass suggestion," Chizhevsky further wrote. - In fact, not a single historical event involving the masses has occurred where it would be impossible to note the compulsion that overwhelms the will of the units. This compulsion in some cases was not limited to any group of people, but embraced cities and entire countries, and its traces were preserved for a long time in the political or military parties, passing from generation to generation and reflected in various works of art. Thus, suggestion in the course of the historical process and the mental evolution of mankind acquires a great significance of paramount importance.

Chizhevsky suggested that "the power of suggestion - the influence of single persons on the masses - increases with the strengthening of the Sun's spot-forming activity". Analysis of numerous historical events, the scientist wrote, showed that "...influence on masses of orators, national leaders, generals does not always have the same power and fluctuates not only periodically by stages of solar cycle, but even by seasons... Therefore there is an assumption that increase of spot forming activity of the Sun, connected with increase of its electric energy, has the strongest influence on the electromagnetic field of the Earth, somehow exciting masses and promoting suggestion".

The "theory of the dependence of the behavior of the masses on cosmic influence" substantiated by Chizhevsky was considered by him not as some theoretical abstraction, but as a guide to action: "The state power must know about the state of the Sun at any given moment. Before making this or that decision, the government needs to ask about the state of the Sun: is it bright, clean or darkened by spots? The sun is a great military and political indicator: its readings are infallible and universal. Therefore, state power must be equal to its arrows: diplomacy - to the monthly, strategy - to the daily. Warlords before every battle must be aware of what is being done on the Sun."

"I have had the privilege of being a decipherer of the remarkable observations of the ancient chroniclers. For many centuries there have been writings carved on blocks of stone or marble, inscribed on parchments and linen paper. Hundreds of highly cultured people of those distant times turned their persistent and inquisitive eyes to the striking simultaneity of solar and terrestrial phenomena.

Therefore I must now say that the idea of a special solar influence on the organism belongs not to me alone, but to hundreds and thousands of those chroniclers and chroniclers who have recorded extraordinary phenomena on the Sun, smog, pestilence and other mass phenomena on the Earth. But I have put ancient thought into the form of numbers, tables, and graphs, and have shown the possibility of prognostication, specifying methods for dealing with them within the biosphere, and the danger to astronauts in outer space.

The study of annals, annals and chronicles gives full assurance that all kinds of ordinary geophysical events are links of the same system: drought afflictions are quickly replaced by water afflictions. Together with these atmospheric phenomena one learns of unheard of earthquakes in many countries or on entire continents. Volcanoes erupt, but immediately the press reports of auroras seen all over Europe and even in subtropical countries. A number of years go by, and all these various events subside. We have to look at meteorological and geophysical phenomena as links in a single chain - the system of the whole body of the Earth".

"...At the same time I asked Dr. A. S. Solovyov to organize a series of similar observations.

Observations of A. S. Solovyov gave extremely curious results, confirming the influence of large storms on the mental sphere of the nervous patients. This influence was reflected in disturbances of the sense of self and blackouts of consciousness, disturbances of volition, drives, increased emotional excitability, irritability, disturbances of motor and cardiovascular activity, sleep disturbances, etc. Women tended to be more reactive than men. Knowing the state of sunshine, it was possible to predict in advance, a week in advance, the 4-5-day periods of general agitation of the patients.

Dr. A. S. Solovyov, at my request, arranged for the observation of defective children in one of the foster homes. Long before I approached him, the [medical](#) and administrative staff of the foster home had noticed that the children's behavior sometimes differed sharply from the average norm. On such days there were often fights and brawls that ended in bruises or injuries. For the emergence of this kind of collective action is enough the slightest occasion, a tiny pretext. I asked for information for a more or less long period of time in order to compare it with the periods of activity of the Sun. And in this case I received a positive result.

At the same time, I have intensively conducted extensive historical research. On the basis of the data obtained, after statistical processing of extremely large material, I came to the following basic conclusion: the number of mass movements in all countries increases with increasing solar activity and reaches a maximum in the years of maximum solar activity. Then this amount begins to decrease and reaches its minimum in years of low solar activity. These cyclical fluctuations of the world-historical process have been detected by me in all countries and in all centuries since 500 B.C."

"...The cosmos or, more precisely, the cosmic world around us is a source of an infinite number of signals continuously bombarding us from all directions. If all these signals were perceived by our consciousness, human life would be extremely shortened, for immediately after the beginning of the process of life there would come a catastrophic overwork of the organism. The limits of light and sound vibrations are limited. Nature has not equipped us with special organs for the perception of other countless signals. But some very vague, vague and dark sensations we have, as well as our physical instruments, which are far from perfect, tell us that the world around us is full of vibrations, vibrations, shocks, currents, disturbances, etc."

Did the great scientist think that he was laying the theoretical and practical foundation for the creation of psychotronic weapons? Most likely, no. As you know, inquisitive Levenhuc studied microbes and experimented on flies - biological weapons were born; the scientific fanaticism of the Curies spouses led to the creation of the atomic bomb, and the ideas of philosopher Fedorov-Tsiolkovsky gave impetus to the creation of rocket-carriers for this very atomic weapon. The road to hell is paved with good intentions.

In 1925, the organizer and head of the Psychoneurological Institute (now named after V.M. Bekhterev) and the Institute for Brain and Mental Activity Research (1918), Academician V. Bekhterev conducted and gave positive results the first experiments on the collective suggestion of emotions at a distance by radio. Seemingly harmless experiments interested the Lubyanka, and to the experiments, having the prospect of creating a future communist society man, is involved daughter of F. Dzerzhinsky M. Talce with a certain docent D. Luntz. They were already purposefully engaged in research in the field of influence of technical means and narcotic drugs on human consciousness, as well as their simultaneous use in various combinations. That is, in fact, they worked on creation of psychotronic and psychotropic weapons. Lubyanka prisoners and patients of psychiatric institutions were used as test subjects.

At the same time the People's Commissariat of Defense was conducting its own series of studies. They are commonly associated with the name of Leonid Leonidovich Vasilyev,

who since 1932 headed a group at the Leningrad Brain Institute, which had previously been personally led by Academician Bekhterev (d. 1927). The scientists were ordered "to begin [experimental](#) research on telepathy in order to ascertain, if possible, its physical nature." The research was conducted from 1932 to 1937 inclusive. Studies on telepathy and teleportation are being conducted nowadays, but we can't speak about any tangible achievements in this field, in our opinion.

At the end of the 1930s an unusual for those years event happened: a researcher of the X-Ray Institute of the Crimean People's Commissariat of Health, a member of the All-Union Society of Surgeons and the All-Union Society of Roentgenologists and Radiologists, a member of the Crimean Scientific Association Boris Georgievich Mikhailovsky was arrested by the NKVD and placed in one of the Lubyanka cells, where he continued his research.

And the research was not easy. The thing is that B. G. Mikhailovsky established: different combinations of electromagnetic pulses modulated in the range of medium and short waves affect the brain zones responsible both for human emotions and for the work of individual organs. He proposed to apply his discovery to the treatment of workers in the Country of the Soviets. But, as mentioned above, the NKVD was already conducting practical work using high-frequency radiation in combination with drugs. Nevertheless, Mikhailovsky's developments also became another stone laid in the foundation for the creation of new weapons.

During World War II, Japanese scientists developed a program called the Death Ray. Although it was never mass-produced, it was considered very promising, and hundreds of thousands of yen were spent on it between 1940 and 1945.

Ideas fly.

The Japanese developed a kind of emitter capable of striking a person outside a shelter at a distance of 8-16 km. In 1943 it was successfully tested: this transmitter, which operated at a certain wavelength, was used to jam car engines, exposed living organisms (mice and pigs) - the wave range of 0.6-2 m caused pulmonary bleeding in them, and the wave range of over 2 m destroyed brain cells.

In Germany, a certain Dr. Voll, a member of the SS Ahnenerbe unit, specialized in the application of ancient occult knowledge in human experiments at the Auschwitz concentration camp. He established the wave characteristics of all major parts of the human body. By achieving resonance between an artificial source of vibrations and a particular organ, it is possible to cure this or that disease. And if one achieves dissonance - destruction, death. The "Ahnenerbe" archive after the war ended up in the Soviet Union. One of the documents described in detail the idea of a psychotronic generator. There was also captured a certain Manfred von Arden, a specialist who participated in developments of Ahnenerbe, which explained the essence and purpose of the generator to NKVD special forces. Based on these developments Belidze-Stakhovsky assembled the first psychotronic generator in the Soviet Union. Around that time (in 1945) this work became known to the Americans. But the U.S. was somewhat behind the Soviet Union. In the late 1950s, Soviet psychotronic weapons left the laboratory buildings of closed research institutes and began to enter the special services.

In 1953, CIA director A. Dulles proposes to begin experiments in the management of human consciousness. The U.S. Congress allocated \$100 million. At the same time, a paragraph was added to the "List of Information Prohibited for Publication", which prohibited open publication of materials on technical means designed to influence human behavioral functions and on the possibilities of controlling human behavior. It was not until 1966 that a 14-volume work was published in the United States entitled A New World

Perspective, which summarized the results of scientific research. It detailed achievements in the development of new weapons, including electromagnetic emitters, to turn humans into biological robots.

In the chapter "The Process of Biological Control" the authors wrote about creating such an electromagnetic energy source, with the help of which it would be possible to control human muscle movements, emotions (and hence actions), put him to sleep and compel him to any thoughts. This radiation is able to influence short-term and long-term memory, as well as in the shortest terms to develop a new set of skills and erase existing ones, i.e., simply speaking, to remove accumulated life experience and replace it with new one, required by some "puppeteers".

The bottom line is simple

The principle of operation of psychotronic weapons is based on the use of electromagnetic, light, thermal, infrasound or ultrasound radiation, as well as the influence on humans of torsion, microleptonic, gravitational fields and bioenergetic (extrasensory) methods of destruction.

As a rule, weapons are used in conjunction with biochemical weapons, psychotropic, narcotic and other means of psychochemistry, which leads to changes in consciousness, the immune system, the state of the human body, a negative impact on his genes, that is, on the heredity.

As a result of the use of these weapons a person, unprotected from its effects, can be remotely, without any violent action, killed or driven to suicide. Various components of psychotronic weapons are used for torture, disabling consciousness, causing irreparable damage to health, physical deformities, changing appearance; for transferring traits from animals to humans in secret genetic experiments with growing of webbing between fingers and toes, nails like claws, etc.; for changing sexual orientation; secret sterilization; artificial impotence; inoculation of alcohol, drug addiction, substance abuse, kleptomania, etc. In addition, when using psychotronic weapons it is possible to control human consciousness at the unconscious level, depriving a person of the ability to self-identification and self-realization; manipulation of individual and collective consciousness; destruction of spirituality and traditional foundations; reading of mental information with psychotronic means; zombification of the population.

It is obvious that effective weapons are tested and used in the strictest secrecy, without the consent of those on whom the methods of their use are tested, as in these experiments a person is regarded only as an object of influence. Hitler's speeches infuriated thousands of people through the special timbre of his voice, his expertly placed speech accents, neurolinguistic gestures and other entourage.

Nowadays everything is much easier, since special devices have already been created. Imagine the prospects for the use of such weapons. Enemies no longer need to be destroyed - they can simply be driven insane. One's own citizens can be programmed to approve any government decision or to do anything, such as approving an important law or voting for a party in power.

According to some scientists, [psychotronic weapons](#) are more terrible than atomic, chemical and bacteriological weapons, because they affect [human](#) heredity and [mind](#), making him a slave to the structure that owns the psychotronic weapons. Unrestricted by any framework, its use can lead to the creation of social castes, i.e. artificial division of people into superior and inferior, and even to degeneration of mankind without the slightest resistance of the latter.

The problem of psychotronic terror directed against civilians is hushed up, criminal cases

are not opened on crimes with the use of psi-weapons, including zombification by electronic means, which is estimated as "serious damage to health without violation of anatomical integrity by introducing in a substituted state of consciousness with control of human psyche from outside". But nevertheless we can trace the results of zombification by means of mass media, social programming, by the influence of advertising, various PR-campaigns, various kinds of psychotechnics, ultrasonic and microwave radiations, psychosurgery and psychopharmacology, etc.

In the mid-1970s, the U.S. public learned about the history of terrible experiments that were conducted by the U.S. military and intelligence agencies. In the Soviet Union, this was a secret behind the seven seals, the citizens of the country had no idea that this was possible, since not only their own, but also Western developments were kept secret. So, in the U.S. it also became known that Dr. Jose Delgado, a famous American scientist, a specialist in the study of brain electro-potentials, had achieved great success, demonstrating with the help of special equipment electric brain stimulation at a distance, causing in subjects such strong emotions as anger, passion, devastation. This was true neurohypnosis - influence directly on the human central nervous system.

In one of his reports, Dr. Delgado wrote: "Exposure to radio stimulation on various parts of the brains of four patients results in a variety of effects, including pleasant feelings, elevated moods, deep mental concentration, unpleasant feelings, super relaxation (bordering on deep hypnosis), color visions, etc."

Delgado believed in the creation of a "psycho-civilized" society and predicted that a computer could be used to establish a two-way communication with the human brain, in which a special "steemosaver" would be implanted. And that day came in 1974.

It was then that [neurophysiologist](#) and electronic engineer Lawrence Pinneo of the Stanford Research Institute developed a computer system capable of reading minds. It produced data from the thought process on an electroencephalograph screen. At present, the CIA is funding the research of Dr. Evan Cameron (a famous American psychologist who conducted experiments on American prisoners). This research is aimed at creating a technique for erasing a person's memory and forcibly altering their personality. In his time, Cameron discovered that electroshock causes memory loss and set about developing a program he called "remodeling"-that is, erasing the former memory. According to his method, people could first be turned into something similar to robots, and then they would be reprogrammed.

When these interesting experiments became known to the broader U.S. scientific community, a furious public forced Cameron to resign in disgrace. At the same time, the U.S. Congress banned such experiments and demanded to "freeze" all these projects. Later, however, former CIA agent Victor Marchetti admitted that the programs were in full swing - they had just been classified even more heavily.

...In the 1980s, NPO Energia was developing means of remote influence on people. This work was done in accordance with a secret decree of January 27, 1986 of the CPSU Central Committee, and in 1989, equipment was created which, once launched into orbit, could correct human behavior in an area the size of the Krasnodar Territory. The equipment was manufactured at the "Arsenal" plant in Kiev.

Similar problems were dealt with by the Kiev Institute of Materials Science, and biogenerators were produced at the Oktava plant. These works were completed in August 1990. The experiments were carried out on animals and volunteers.

A group of psychologists from the I.M. Sechenov Moscow Medical Academy worked on the topic "Computer-based Psychotechnologies. I.M. Sechenov Moscow Medical Academy worked on the topic "Computer psychotechnologies". Scientists were engaged in finding

out the influence of encoded signals on the psyche, and in fact - the action of psychotronic weapons.

Under outside influence?

There is a rather hypothetical assumption that the psychotronic generators were on board the American cruiser "Belkap", moored in Varna on August 18-19, 1991. Direct mental influence on Muscovites was carried out from the board of [the cruiser](#). The same device was used in Moscow during Boris Yeltsin's famous speech. Yeltsin on the armored car. We have no possibility to confirm or deny this data, but there is no doubt that remote influence on the crowd behavior is technically possible. Is that not why during, let it be said, the "reign" of H.B.N., shielding antennas were installed in his office. What kind of radiation was he afraid of, not coding for drunkenness?

On August 21, 1991, Russia failed, by today's standards, a "velvet" and completely incomprehensible putsch by the Gekachepists. The ringleaders of the plot were arrested. And what followed, as one can only suppose, the elimination of dangerous witnesses, capable to reveal all the details of the putsch and the hidden threads of the conspiracy, began. Something incomprehensible was going on. The first death of a participant of the GKChP (State Committee for the State of Emergency) has not yet seemed strange to anybody. A few minutes before his arrest, Interior Minister B. K. Pugo shot himself. It could be seen as a voluntary departure from life of a fanatical communist. But a chain of strange suicides followed.

Marshal S.F. Akhromeev hanged himself under mysterious circumstances. He did not shoot himself, as it is customary for officers, from a pistol, which was lying, by the way, in a drawer of his desk, but hanged himself. He hanged himself sitting with his legs bent at the knees. It is a rare method, used mostly by criminals in cramped prison cells, away from the door peephole.

From the balcony of his apartment, N. E. Kruchina, head of the CPSU Central Committee, rushed to the sidewalk.

Soon, a similarly absurd death befell Kruchina's predecessor as head of administration, the octogenarian G. Pavlov. He was watching TV on a Sunday morning, then got up and went out to his office in silence. When his wife followed him out just a minute later, the room was empty. By the opened window there were slippers on the carpet, a note on the table with a firm hand: "Cremation only!", and Pavlov himself lay dead under the window... Together with him finally gone into oblivion secrets of party cash, codes and account numbers in foreign banks, other party secrets.

Another major employee of the CPSU Central Committee, Dmitry Lisovets, threw himself from the twelfth floor. He was at home with his wife and guests, then, without saying a word to anyone, went to the window...

Just an epidemic of suicides. Of course, at that time, the investigators were not searching for the causes of the deaths of some partocrats, but for their own fate, they were in a hurry to become democrats. Otherwise, they might have had a question: by whose evil will were healthy, mentally and physically tough guys shooting themselves, hanging themselves, throwing themselves out the windows? Well, not of their own free will? Maybe there was some force that drove them to their deaths? In the early 1980s, especially important members of the Central Committee were coded with so-called sound bites. It was enough to utter a codeword over the telephone or radio, and the person would carry out any command previously laid down in his subconscious. Was such a command given? By whom?

But we can neither confirm nor deny the following information, because many mass media

like "hotter". It was reported that in August of the same 1991 was published the Statement of Professor Victor Alexandrovich Sedletsky, head and chief designer of the center "Forma" of the Association of Machine-Technologists of international consortium "ECOPROM", vice-president of the League of independent scientists of Russia: "As a specialist and legal entity, I confirm: in Kiev started mass production of psychotronic generators and their testing. I cannot assert that it was the Kiev generators that were used during the putsch. For such a statement it is necessary to know their technical characteristics. But the fact of their use is obvious. I officially notified the government about my considerations in this matter (psychotronic biogenerators are a reality and their malicious use is possible). But I didn't get any answer".

Immediately after this publication, V. A. Sedletsky disappeared. A. Sedletsky disappeared.

And yet during those memorable events, General Kobets, who led the protection of the "White House", warned about the possibility of using psychotronic generators. Later Kobets was convicted of corruption and something else, and disappeared from the political arena of Russia once and for all. Well, what a bang for the buck! That's it, the whole mess with Yeltsin's rise to power - the work of some eyeglasses and their generators?

The foreign press notes: years of research on the creation of psychotronic weapons have yielded good results. I guess we have nothing else to do but believe the faceless "foreign press" this time.

Managing mass consciousness

Yes, there are problems of a purely technical nature, and the main one is that the mass use of psychotronic radiation for military purposes requires completely new developments to create effective devices, associated with huge investments and energy costs.

But didn't it take nothing to produce weapons before, didn't mankind go to great human and material expense to create effective weapons?

On July 21, 1994, U.S. Secretary of Defense William Perry signed a memorandum on "non-lethal weapons" with a list of cases in which it is permissible to use them. First on the list was "crowd control," and fifth was "disabling and destroying weapons or military production, including weapons of mass destruction. The following July, Spordight published an article in which Harvard physics professor Dr. Emery Horvath stated, "These electronic 'scalposnimators' are designed for government officials to infiltrate the brain, disorient crowds of people or manipulate individuals into ceasing to be themselves. It's an absolutely horrible weapon.

Almost all of this technology was developed at the famous Los Alamos laboratory as part of the national program to create so-called non-lethal weapons. What a chaste definition! We can only add to the words of the distinguished professor that, at present, non-lethal weapons are not subject to any international convention that would prohibit their development, stockpiling and use. And, apparently, some of the developments are being applied with all their might. Geophysicist Gordon J.F. MacDonald, [a specialist in](#) military technology, has noted that "electron strikes that are artificially generated and delivered at a certain frequency can lead to strong vibrations that create fairly high energy levels over certain areas ... Thus, a system can be developed that would greatly impede the brain activity of large populations in selected areas for long periods of time. Although the prospect of using the environment to manipulate behavior in the national interest is very troubling, it is likely that technologies providing such an effect will be developed in the coming decades..."

In the words of MacDonald, who spoke in many newspapers of the time about methods of mind control, "the key to geophysical weaponry is a way of detecting phenomena of

environmental instability. Then it is enough to stimulate them with a relatively small charge of energy to unleash much larger amounts of energy".

Begich and Manning wondered, "Isn't the HAARP project an embodiment of the predictions of past geophysicists? They also noted at the time that the application of energy to potential environmental phenomena can lead to impressive results. Mankind has already spewed large amounts of electromagnetic energy into the environment without thinking that it could exceed a critical mass.

Published materials of the US Air Force eloquently testify: "Potential applications of artificial electromagnetic fields can be found in many areas and can be used in military conflicts and similar situations... Some possible aspects of application: capture of terrorist groups, control of large crowds of people, control over violations of military or special facilities, and impact on enemy soldiers in tactical warfare.

In all these cases electromagnetic systems will be used to produce physiological disturbances (from mild to extremely severe) or sensory disturbances including loss of orientation. In addition, the functional activity of individuals may be reduced to the level of inability to take part in combat operations. Another advantage of electromagnetic systems is that each can cover large areas. They operate silently and countermeasures are hardly possible."

The fact that another capability of HAARP could be its use against the population of their own country is probably only whispered by the highest officials of the US military department. Therefore, even the mere mention that HAARP is a weapons system, not an experimental scientific project, can cause a storm of protests from the U.S. population. This is why the U.S. government is so careful to protect the unclassified status of the project, presenting it as a simple study of radio capabilities and the study of the upper layers of the Earth's atmosphere.

By the way, everyone knows that lasers are also used to create holographic images. Laser technology today makes it possible to project, for example, moving three-dimensional images on clouds. With regard to the subject of psychotronic weapons: scientists have established that holographic images are capable of influencing the human psyche, especially under extreme or combat conditions.

American developers are already planning to create holographic images of various authority figures in the sky, who will advise "their fellow believers" to stop resisting, surrender at the mercy of the enemy and return home. This idea is borrowed by the U.S. military from advertising and entertainment shows.

Psychological "mines"

In our turbulent times in Russia, many company executives have begun to invest in their own protection against information and psychological influence. Hired specialists receive \$3,000 to \$4,000 each for searching for so-called psychological "land mines", calculating "information killers", and hunting down these very psychoterrorists (psychoprogrammers). Businessmen began to be advised on information-psychological security on the basis of a special system developed by information security specialists.

Psychological "mines" can be considered a weapon of the XXI century. By planting them, the perpetrators do not commit anything illegal. In the morning, when people are on their way to work, in a crowded bus passing a well-known shopping center in the city, one passenger says loudly to another: "Did you hear the news? They shot the owner of that store yesterday." And he gives his last name. There are many variations: "their car was blown up," "the office was shot at," "the garage was burned down," etc. On the whole, the first intermediate goal is reached-the rumors begin to spread, and more and more details

emerge. Soon the object of psychological influence learns about his "troubles."

Psychological pressure is exerted on a person all the time, and even more so in business. The most elementary method is persuasion. But there are more subtle methods. This is an art, which is dealt with by professionals. This refers to laying information and psychological "mine-stretchers". A "mine" is a conditional, but appropriate name, because it is a certain block of information, which is laid at one time, and works, for example, in six months.

One of the first stages of bookmarking is the study of the object's weaknesses: "A phobia can be a person's fear of crossing the road, a fear of water, a negative perception of some spectrum of colors, etc. This is what people who know psychology well use. Knowing the pronounced phobias of life, it is possible to predict and provoke some phobias in business.

The object's behavior at work and at home is tracked, and anatomical, psychological and emotional maps are drawn. Based on the information gathered, it is possible to determine which phobia the person is most susceptible to. A conversation between two people in a crowded bus is one of the elements of laying a psychological landmine. There is such a concept as "visual picture modeling", for example, a situation is created under the office window, after which the person's brain center responsible for an aggravated sense of danger is activated.

Any situation can be simulated. For example, a car runs over a man outside his office window. Or they put an open canister of gasoline next to a businessman's car and put a box of matches next to it. And the entrepreneur, seeing this picture, begins to create a whole series of associative rows in his head, gets himself depressed, and then takes the wrong steps, which he would have abandoned before. And at first glance, nothing happened.

There were no illegal actions. Nevertheless, the effect was achieved. After laying a "mine" a person at the level of psychosomatic reactions can get a heart attack, stroke, nervous breakdown, it is even possible to provoke a fatal outcome. A businessman crashed his car, drowned in a river, fell out the window. On the surface, it looks like an accident. But in fact a land mine went off.

At best, as a result of the constant influence of the psychoterrorist, the person reaches the point of acute neurosis and goes out of business. Or agrees to the demands of those who hired this psycho-terrorist for their far-reaching goals.

Neuro-linguistic programming (NLP), used in advertising, marketing, and consulting, has been known for a couple of decades, but has only recently been recognized by science. NLP in business is an effective tool, but it is not used to its full potential. NLP deals with the two impulsive systems a person uses to relate to the world.

These are the nervous system and the system of verbal interaction. However, there is a third system, which is not officially recognized by science, but is already used in a number of institutes. This is the vibrational system, which has infinite possibilities. It is possible to work with this system only at the level of one's own sensations. That is, a "mine" can be laid without direct communication with the object. If you meet him with a glance, that will be enough.

It is believed that modern information killers are people who have previously mastered NLP. They do not advertise and generally do not advertise their activities. In Moscow such specialists are in high demand, they belong to the highest caste, because they possess the most terrible and destructive weapon today.

There is a system called "Gryphon" which allows a person to detect and neutralize psychological "mines". The system is interesting because, in addition to traditional psychotechnologies, it uses the methods of shamans, some of the most ancient masters of

psychological influence.

A person who has mastered the "Gryphon" system begins to work with his information space. In addition to localizing informational influence, the system allows you to restore emotional balance in critical situations. In fact, we are all very strongly socially conditioned and fall under certain patterns. Knowing these patterns, we can be influenced. Once a person falls out of a standard situation, he becomes more vulnerable. The concept of the system is aimed precisely at getting every businessman used to thinking non-standardly, non-linearly. And to apply these non-standard steps in business, making the most of their opportunities.

Against...

Here is an excerpt from a letter of appeal from the participants of the international colloquium "New Frontiers in Experimental Medicine and Field Energy" held at the J. Fetzer Center in Kalamazoo (Michigan, USA) on April 13, 1989: "Given the devastating experience of the use of atomic energy for military and political purposes and in order to prevent the disastrous consequences of uncontrolled use of unusual human abilities and devices and devices created on this basis, we appeal to all scientists, the world public, governments and We call for a declaration that it is unacceptable, under any circumstances, to use human psychic energy in any action against humanity, and for us to assume a voluntary obligation never, under any circumstances, to use such weapons and to sign an international convention to that effect.

In Russia, a similar appeal was published in the newspaper "The Voice of the Universe", #6-7, 1991. It contains the demand of victims of psychoterror "to ban and destroy all bioenergetical weapons in the USSR, which are capable of exerting any influence on human mental and psychic activity at a distance and causing irreparable harm to human life and health".

Among these demands was one more: "to immediately stop the psychoterror carried out by the state bodies and scientific mafia, and introduce articles into the criminal legislation punishing the use of psychotronic weapons on the territory of Russia". The end of the appeal reads as follows: "Today they kill us, tomorrow the same fate may befall you and your children".

...The background to everything we are talking about here is, of course, known only by the agencies at whose direction these developments are taking place, as well as by those who carry them out.

G. Green, a law professor at the University of Washington, put it this way in 1969: "It is difficult to imagine that the people in charge of a new branch of technology would speak frankly about its undesirable social consequences. There must be some independent, unbiased governmental body, a kind of devil's advocate, looking for shady sides in everything, to inform Congress, the president, and the general public about the possible social costs.

There are testimonies of people on whom psi-weapons were tested. But official authorities in both the U.S. and us deny it. Although Lieutenant General Daniel Graham, former director of the Intelligence Agency, Department of Defense, did not deny the possibility of mental manipulation experiments. "I would be terribly amazed if our intelligence agencies were not dealing with this problem," he told the Times.

Reports about the "mc-ultra" program occasionally make their way onto the pages of Western newspapers. This program includes electronic manipulation of the brain with ultrasound and microwave radiation. It also includes psychotronic devices as a means of relaxing the will and the use of computer technology in combination with hypnosis, as well

as other means of influencing the psyche to create entire programs of human behavior.

One of the secret organizations involved in human behavior management experiments in America is the top-secret research center, the Edwast Research Project Agency.

And here is an absolutely, it would seem, fantastic project. American scientists Erike, Glaser, and Shah brought the development of space power systems to practical engineering solutions back in the 1960s.

What is the essence of their feasible project? The solar cells deployed in Earth orbit convert the energy of sunlight into electric current, which is converted into microwave radiation using a high-frequency generator (klystron, magnetron, etc.). It is focused and directed as a thin "power beam" to a ground receiving antenna. If the frequency is in the range of 2-3 GHz, such a beam does not interact with the atmosphere and is safe for ground objects accidentally hit by the beam.

However, a new twist is possible here: the very microwave energy systems we need are easily reconfigured on command from Earth, turning into a terrible psychotronic weapon that kills all sentient beings. For it acts directly on the brain.

What prevents you from raising the energy density in a microwave beam to millions or even billions of watts per square centimeter? Nothing prevents us from changing the frequency of radiation as well. From cosmic energy system to a military weapon - one step: without any constructive modification, one reconfiguration (by command from Earth or some remote secret space center) microwave energy system easily turns into a psychotronic weapon. Unfortunately, life testifies: there is always a certain "historical personality" capable of making this step. There are such personalities in Russia too.

Acoustic weapons

This type of impact on the human central nervous system is defined as an acoustic weapon (AK), but it is thought that AK can be considered one of the components of psychotronic weapons. And this does not require much proof.

...In the early 1990s, former KGB operative General Oleg Kalugin reported in interviews that there was a device in Russia that allowed to modify human behavior, to turn it into an obedient biorobot. He was referring to the generator, which in the early 90's was created in the Soviet Union, one of the "numbered institutes. This generator was based on the resonance acoustic effect. The device could radiate a beam at a distance of several hundred meters, affecting large audiences. It is surprising that the former general trumpeted this as if he had made a discovery. Nothing for his new masters Kalugin discovered.

The idea of such a generator was literally and figuratively in the air. Back in the XIX century it was noticed that birds die when exposed to low frequencies. In the 1930s in a London theater, the English physicist Wood used a technical innovation to enhance the musical effect. In order to enhance the sense of tragedy of the play, infrasound was added to the bass of the orchestra - ultra-low frequencies, which were radiated in the hall by a special acoustic device. These inaudible "super-basses" affected the subcortex of the audience in such a way that a real panic broke out among them. And it is easy enough to assemble acoustic impact devices, and any radio amateur can do it at home.

Here is what G. Chadd wrote about the impact of sound on the human psyche: "Infrasound due to its huge wavelength cannot be stopped by the usual building constructions, with the help of which people often protect themselves from all sorts of harmful influences. The long wavelength allows infrasound to travel considerable distances in the atmosphere, reaching tens of thousands of kilometers.

Intense low-frequency vibrations can affect the central nervous system and digestive organs, leading to general malaise, headache, and pain in internal organs. Higher signal levels at several hertz frequencies can cause dizziness, nausea, unconsciousness, and sometimes blindness. These weapons can also cause panic, loss of self-control and an irresistible urge to escape from the source of attack. Acoustic weapons drive enemy soldiers to suicide, turn entire military formations into a crowd of idiots, and the complete and irreversible destruction of the psyche of individuals is possible.

In 1989, CNN aired a documentary on acoustic weapons and presented the U.S. government with a document outlining a plan to use these weapons against terrorists. Before the film was shown, a U.S. Defense Department spokesman stated that microwaves and "other modulators" were routinely used by the Israelis to subdue the Palestinians.

In May 1994, almost at the same time as Kalugin's revelations, an American scientific journal published an article about "non-lethal weapons. Among other things, they named low-frequency infrasound generators powerful enough to cause nausea and stomach upsets. Samples of acoustic weapons can even be found on store shelves. Trade organizations offer infrasound generators (about 9 Hz) to control rats. They are accompanied by a memo, recommending to use the devices in warehouses at night, when there are no personnel. It should be noted that in our country, few people are seriously interested in the memo, and in fact such a generator, intentionally "forgotten" in the apartment of the enemy included, can cause serious harm to his mental health.

The use of sound generators can cause anxiety, despair, horror, provoke fatal convulsions. It is proven in practice - the human brain functions in a certain biorhythm. It is disturbed in mentally ill people - a schizophrenic has some biorhythms, an epileptic has others. Failure occurs for different reasons, but it can be caused on purpose. Acoustic weapons mainly involve three frequency ranges - infrasound, with a frequency range below 20 Hz, audible range (20 Hz to 20 kHz) and ultrasound (above 20 kHz). Such gradation is determined by the peculiarities of the impact of sound on the human body and, above all, on its auditory apparatus. It is established that the hearing thresholds, pain levels and other negative impacts on the human body decrease with an increase in sound frequency from several hertz to 250 Hz.

Infrasound at levels of 110 to 130 dB has a negative effect on the gastrointestinal tract organs, causing pain and nausea. At the same time, high levels of anxiety and distress are achieved at minute exposures already at levels of 90 to 120 dB at low frequencies (5 to 200 Hz), and severe physical injuries and damage occur at levels of 140 to 150 dB.

At low frequencies, excitable resonances of internal organs can cause bleeding and spasms, and in the middle frequency range (0.5-2.5 kHz) resonances in the air cavities of the body will cause nervous excitement, tissue trauma and overheating of internal organs.

Fluctuations above 100 Hz are not felt or heard, but they affect thinking and the nervous system. The result is headaches, dizziness, visual and breathing disorders, convulsions.

In 1986 Kim Bespy (d. July 1996), leader of the Women's Peace Camp located near the military base at Greenham Common, USA, catalogued the symptoms caused by the low-frequency signals the military was treating female protesters with. This exposure manifested itself in dizziness, frequent rupture of eye vessels, facial burns (even at night), nausea, sleep disturbance, heart palpitations, memory loss, inability to concentrate, disorientation, severe headaches, temporary paralysis, speech disorders, irritability, unreasonable feelings of panic. Dr. Robert Becker, a specialist in the effects of electromagnetic waves on the human body from Stanford University, confirmed that the symptoms observed in the Greenham-Common women were similar to those that occur

when exposed to acoustic weapons.

The Sleeping Beauty program, which aims to create acoustic weapons that affect the psyche of enemy soldiers during military operations, is currently underway in the United States. The project is led by Jack Vernon, a high-ranking U.S. military intelligence officer.

Specialists working on the creation of acoustic devices within the framework of the creation of so-called non-lethal weapons, know the radio-acoustic effect of microwave. Its essence is the following. If you send a person superfrequency beam of microwave generator, which made completely not perceived by the ear modulation of his voice, then the effect of "inner voice" will be created. This voice can "prompt" ambiguous decisions and inadequate actions, committing which the person remains confident that it is his own desire.

An experiment was conducted in the laboratory - a loudspeaker was placed in the ventilation system, through which a simple poem was broadcast: "There are rats starving in the basement, hurry up and bring them food..." It sounded like an ordinary fan noise. Within three days, laboratory workers were already hauling packs of food from home to work. Specialists explain that this kind of zombification is not perceived as an imposed command. On the contrary, a person feels that such actions are prompted by an inner voice, and these thoughts are perceived as his own.

In recent years in the United States there has been a wide range of work in the field of non-lethal weapons at the Army Weapons Research, Development and Maintenance Center in the Patatinni Arsenal (New Jersey). A number of projects to create devices that form acoustic "bullets" emitted by large-diameter antennas have been carried out by the Association for Scientific Research and Applications in Huntington Beach, California.

According to the idea of the creators of the new weapon, it should expand the possible range of use of military force not only on the battlefield, but also during police or peacekeeping operations. Research is underway to develop infrasound systems based on the use of large loudspeakers. The work, aimed at creating acoustic weapons of high power and low frequency, is intended to protect U.S. institutions abroad. Microwave radiation generators have already been created for remote impact on crowds of people. According to the magazine, the emitter affects the human body with a narrow microwave beam. The waves penetrate under the skin and quickly "heat" the affected area to a temperature of 45°C or higher. This inevitably causes people to go into painful shock and even lose consciousness.

So picket the embassies.

In Great Britain, infrasound emitters have been developed that affect not only the human hearing aid, but also cause resonance of internal organs with heart disruption, up to and including death. These weapons were used in the fight against riots in Northern Ireland.

Acoustic "bullets" of very low frequencies, produced by the superposition of ultrasonic vibrations emitted by large antennas, were also tested to hit military personnel in bunkers and in combat vehicles. According to American specialists on non-lethal weapons, Russia is also working in the field of acoustic weapons, and impressive results have been obtained. The Americans, in particular, declared that they had been shown in Russia a functioning device generating an infrasonic pulse of 10 Hz, "the size of a baseball", the power of which is allegedly sufficient to inflict heavy damage on a person at a distance of hundreds of meters, up to the lethal outcome. We can neither confirm nor deny this report, since the Russian media have not reported any developments in the field of acoustic weapons in our country.

Infrasound is a companion to our everyday life, because even at home we are constantly

exposed to infrasound vibrations produced by the street. Exposure to infrasound can influence the decision of a person who has experienced domestic stress to end his or her life. Infrasound vibrations can cause a state of anxiety, despair, and terror. Exposure to infrasound radiation on people leads to epilepsy, and at high power radiation - to death. Death can come as a result of a sharp dysfunction of the individual organs, the defeat of the cardiovascular system, the destruction of blood vessels and internal organs. Specialists believe that the selection of radiation of certain frequency can provoke massive manifestations of myocardial infarction in the troops and the enemy population. The ability of infrasonic vibrations to penetrate concrete and metal barriers should be taken into account, which increases interest in this weapon.

It is known that today the USA has generators of low-frequency oscillations (causing dizziness, nausea, etc.) and generators of directional electromagnetic radiation, capable of causing the phenomenon of radio sound in the client's head. The NATO command established a special working group on non-lethal means of action.
